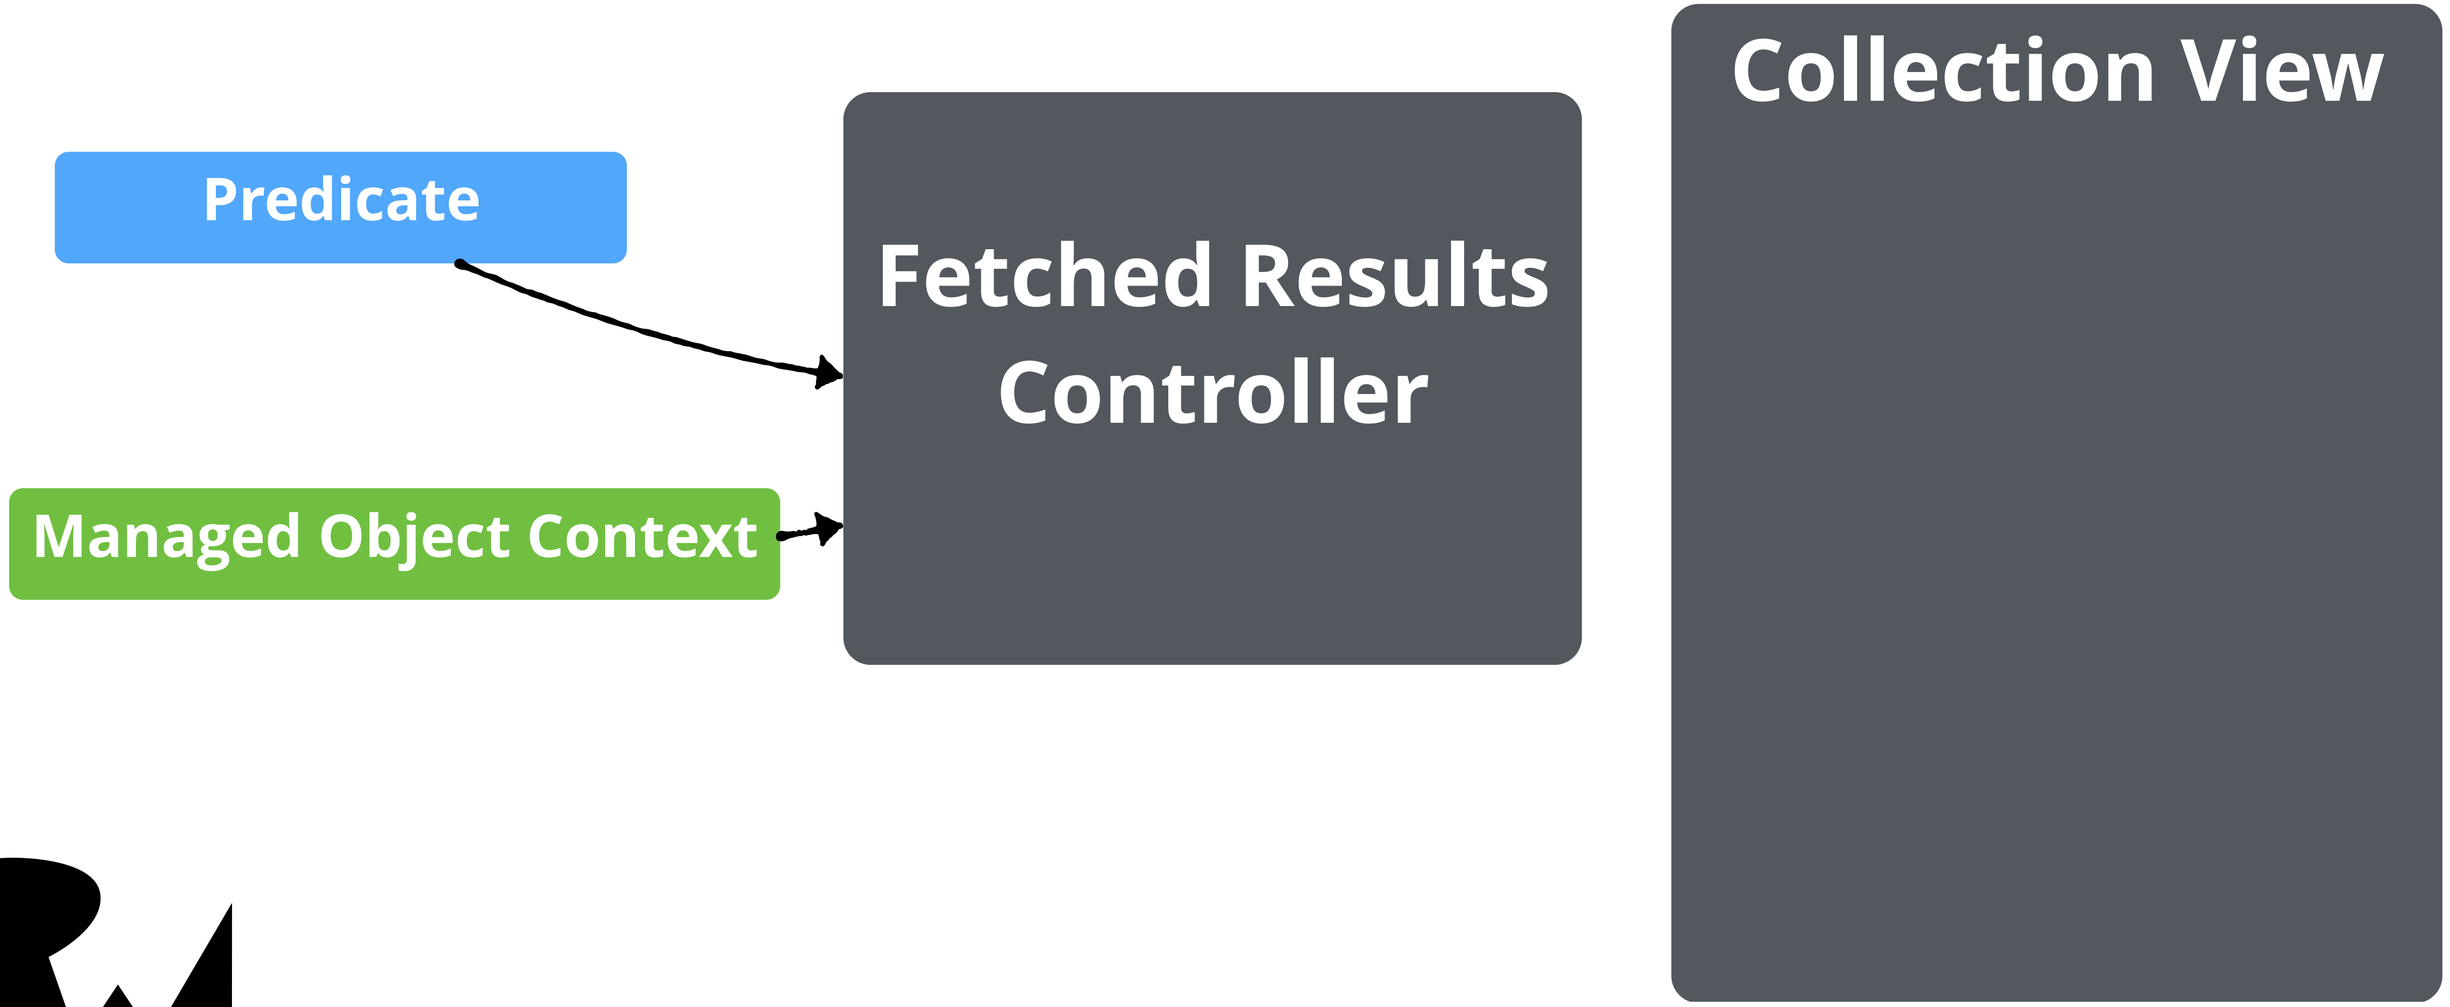
Fetched Results Controllers



Fetched Results Controllers

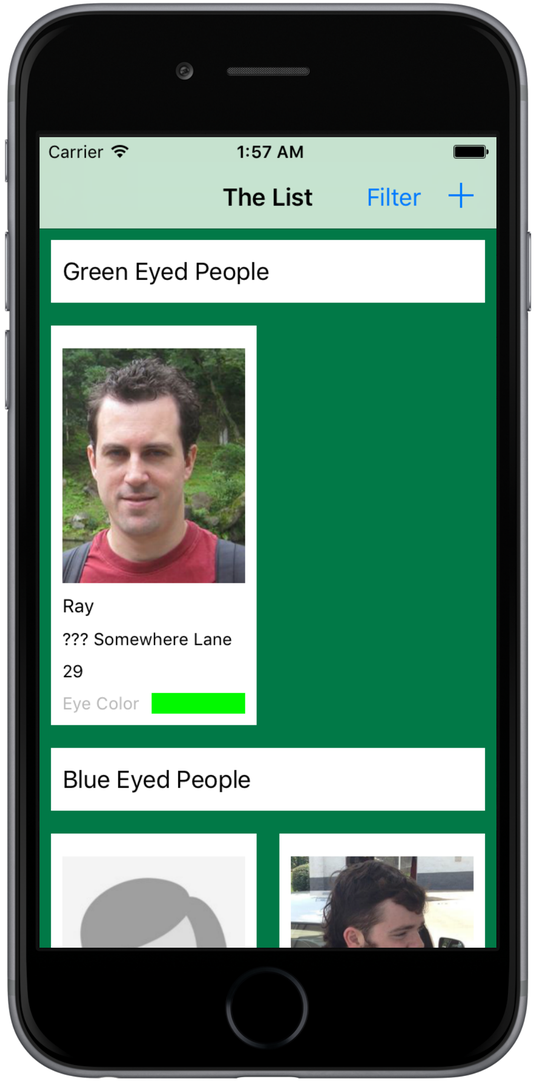
```
NSFetchedResultsController(fetchRequest: NSFetchRequest,
                           managedObjectContext:NSManagedObjectContext,
                           sectionNameKeyPath: String?,
                           cacheName: String?)
```

Caching Results

- Needs a unique cache key (String)
- Caching persists between launches
- Speeds up data access

* Changing the fetch request means you must invalidate the cache!

Fetched Results Delegate

- Automatically listens for changes
- Calls callback when changes occur


Challenge Time!
